Collections in Javascript

Our Goals

- Identify the types of collections in Javascript
- Talk about the differences between them
- Identify the common methods and properties that are available on those collections

There are two types

- Arrays
- Objects

Both are very common. Arrays are like grocery lists, objects are like dictionaries

The Array

- Holds an ordered list, filled with any type of data
- It is zero-based which causes a lot of problems

Why would you use Arrays?

- To keep an ordered list of anything
- If you need **iteration**

Creating Arrays

```
var emptyArray = [];
var randomNumbers = [ 12, 42, 1, 3, 92 ];
var rainbowColours = ['red', 'orange', 'yellow', 'green'];
var weirdInstruments = [
    "Badgermin",
    "The Great Stalacpipe Organ",
    "Stylophone",
    "Ondes Martenot",
    "Sharpischord",
    "Hydraulophone",
    "Pyrophone"
];
```

Accessing Elements

```
var weirdInstruments = [
    "Badgermin",
    "The Great Stalacpipe Organ",
    "Stylophone",
    "Ondes Martenot",
    "Sharpischord",
    "Hydraulophone",
    "Pyrophone"
];
weirdInstruments[0];
weirdInstruments[5];
weirdInstruments[ weirdInstruments.length - 1 ];
```

Accessing Elements

```
var rainbowColours = [
    'red',
    'orange',
    'yellow',
    'blue',
    'green'
];
var firstColour = rainbowColours[0];
var secondColour = rainbowColours[1];
var lastColour = rainbowColours[rainbowColours.length - 1];
```

Reassigning Values

```
var rainbowColours = [
    'red',
    'orange',
    'yellow',
    'blue',
    'green'
];
rainbowColours[0] = "Indigo";
rainbowColours[1] = "Purple";
rainbowColours[5] = "Violet";
```

Adding Elements

```
var fruits = ["Orange", "Banana", "Apple"];
// Adding to the end
fruits.push( "Kiwi Fruit" );
// Adding to the start
fruits.unshift( "Mango" );
```

Removing Elements

```
var fruits = ["Mango", "Orange", "Banana", "Apple", "Kiwi Fruit"];
fruits.pop();
fruits.shift();
```

Finding an item

```
var fruits = [
    "Mango",
    "Orange",
    "Banana",
    "Apple",
    "Kiwi Fruit"
];
var indexOfMango = fruits.indexOf( "Mango" ); // => 0
var indexOfBanana = fruits.indexOf( "Banana" ); // => 2
var indexOfKiwi = fruits.indexOf( "Kiwi Fruit" ); // => 4
var mango = fruits[ indexOfMango ]; // => "Mango"
fruits.includes( "Spaghetti" ); // => false
fruits.indexOf( "Spaghetti" ); // => -1
```

Removing an item by index

```
var fruits = [
    "Mango",
    "Orange",
    "Banana",
    "Apple",
    "Kiwi Fruit"
];
var bananaIndex = fruits.indexOf( "Banana" );
fruits.splice( bananaIndex, 1 );
```

Copying an array

```
var fruits = [
    "Mango",
    "Orange",
    "Banana",
    "Apple",
    "Kiwi Fruit"
];
var newFruits = fruits.slice();
// Copy everything
var twoFruits = fruits.slice( 1, 3 );
// Copy from index 1 to index 3
```

Looping through an array

```
var fruits = [
    "Mango",
    "Orange",
    "Banana",
    "Apple",
    "Kiwi Fruit"
];
for ( var i = 0; i < fruits.length; i++ ) {</pre>
    var fruit = fruits[ i ];
    console.log( fruit );
```

Review

```
var fruits = [ "Mango", "Orange" ];
var firstFruit = fruits[0];
// => "Mango"
var secondFruit = fruits[fruits.length - 1];
// => "Orange"
fruits.pop(); // Remove the last element
fruits.push("Orange"); // Add Orange to the end
fruits.shift(); // Remove the first element
fruits.unshift("Mango"); // Add Mango to the start
for (var i = 0; i < fruits.length; i++) {</pre>
    console.log( fruits[i] );
```

- Speaking Javascript: Arrays
- Eloquent Javascript: Arrays
- Javascript.info's Description

Objects

Objects

- A dictionary
- Contains an unordered list of definitions
- It's not integer-based, it's word-based
- They are made up of key-value pairs

Why would you use Objects?

- Encapsulation grouping functionality
- Give names to values
- Work with large amounts of effectively

Creating Objects

```
var emptyObject = {};
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
};
var bookSeries = {
    name: "In Search of Lost Time",
    author: "Marcel Proust",
    books: [
        "Swann's Way",
        "In the Shadow of Young Girls in Flower",
        "Sodom and Gomorrah",
        "The Prisoner",
        "The Fugitive",
        "Time Regained"
```

Accessing Values

```
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
var movieName = movie.name;
var movieDirector = movie.director;
var movieDuration = movie.duration;
```

Accessing Values

```
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
var movieName = movie["name"];
var movieDirector = movie["director"];
var movieDuration = movie["duration"];
movie["gobbledygook"]; // => undefined
```

Reassigning Values

```
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
movie.name = "Sátántangó";
movie.director = "Béla Tarr";
movie.duration = 534;
```

Adding new values

```
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
movie.language = "Hungarian";
movie.rating = 21412523224616982;
movie.parts = 12;
```

Destroying Properties

```
var bestCamera = {
    brand: "Leica",
    model: "M3",
    year: 1955,
    memoryCard: "SD"
delete bestCamera.memoryCard;
```

Looping through Objects

```
var movie = {
    name: "Satantango",
    director: "Bela Tarr",
    duration: 432
for ( var key in movie ) {
    console.log( key + ": " + movie[key] );
var movieKeys = Object.keys( movie );
// => ["name", "director", "duration"]
```

Nested Objects

```
var explorer = {
    firstName: "Jacques",
    lastName: "Cousteau",
    birth: {
        day: 11,
        month: 6,
        year: 1910
};
var birthDay = explorer.birth.day;
var birthMonth = explorer.birth.month;
var birthYear = explorer.birth.year;
var jacques = explorer.firstName;
var cousteau = explorer.lastName;
```

Methods

```
var explorer = {
    firstName: "Jacques",
    lastName: "Cousteau",
    displayPurpose: function () {
        alert( "Hello World" );
explorer.displayPurpose();
```

Complex Data Structures

```
var marxFamily = [
    { name: "Groucho", birthYear: 1890 },
      name: "Harpo", birthYear: 1888 },
      name: "Chico", birthYear: 1887 },
    { name: "Zeppo", birthYear: 1901 },
    { name: "Gummo", birthYear: 1893 }
];
for ( var i = 0; i < marxFamily.length; i++ ) {</pre>
    var brother = marxFamily[ i ];
    console.log( brother.name, brother.birthYear );
```

Our first intro to This

```
var explorer = {
  firstName: "Jacques",
  lastName: "Cousteau",
  displayFullName: function () {
    var fullName = this.firstName + " " + this.lastName;
    return fullName;
  talkTo: function (name) {
    var greeting = this.firstName + " says hi to " + name;
    return greeting;
explorer.displayFullName();
```
